

# Intermodal Linkage

## Ports Partnering with Railroads

**AAPA Facilities Engineering Seminar & Expo**

**November 9, 2011**

**Panel VIII**

**Dave Maas**

# Thoughts, Recommendations and Reminders

- Partnership
- Operating Plan
- Tradeoffs
- Measuring Value
- Summary

# East Coast and West Coast Partnership Examples

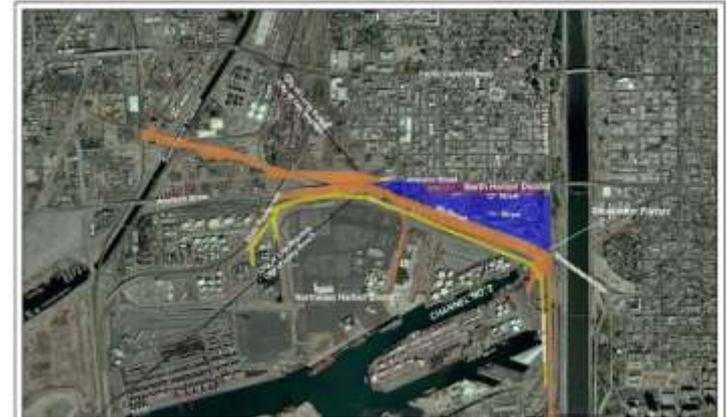

## Vintage :

- The Port of Baltimore
- The Port of Oakland

## In Development :

- The Port of Long Beach Pier B Yard
- Port of Miami

# Commercial - “Who Pays for What”

## ► Commercial Agreement

- Parties
- Terms
- Conditions
- Liability
- Operating Plan ?

***Provide as much detail as possible in the operating plan as a portion of the commercial agreement.***

***Use a top down approach and add details as required or as it becomes available.***

# Operating Plan – “Use a Top Down Approach”

- **Do the Operations Analysis before facility design**
- **Service Plan drives facility requirements and resources**
- **Sequence and level of detail are important**
  1. Capacity Requirements
  2. Performance Expectations
  3. Performance Measures
  4. Service Plan Option Evaluation
  5. Capital Investment
  6. Resources

# Operating Plan – “Who Is Responsible For What When”

## ➤ Operating Plan Is Driven By:

- Freight forecast
- Train Service
- Hours of Operation
- Interface between parties
  - Drayage Service
  - Documentation
  - Customs and Security
  - Tactical Planning

***Who is responsible for the Box/Chassis/Information when?***

# An Operating Plan Includes but is not limited to:

- Train service
- Port to/from rail Drayage Service
- Rail staging capacity
- Infrastructure
- Equipment
- Technology
- Manpower
- Customs
- Security

# An Operating Plan Explores Tradeoffs

- Infrastructure
- Service
- Processes
- Technology
- Manpower

***Explore tradeoffs, understand the sensitivity and risks, size accordingly, then design, build, and implement.***

***Seek first to understand requirements and sensitivity .***

# Operations Analysis Allows You To Evaluate Tradeoffs

- ▶ Evaluating the tradeoffs between service, process rates, infrastructure, and resources provides a business solution where the value of each component can be measured.

Service Plan

Process Rates

Resources

Infrastructure

# Technology Applications and Shared Use of the Information

- Inspection systems
- Lift equipment
- Drayage equipment
- Facility inventory systems
- Security systems
- Train management system
- Operating systems for movements & inventory Management

***Choose the correct technology to match or enhance the operations efficiency and/or effectiveness.***

# Operating Plan Is A Tool for Measuring Value

- Bridging the **potential gap** between shipper, port authority, railroad, transportation organizations, engineering, and operators to determine required resources to meet expectations.
- Provides **capability** to analysis complex operations before spending large amounts of time and resources.
- Ability to measure **tradeoffs** between service, processes , and resources.
- Ability to measure **efficiency and effectiveness** of multi-discipline operations and processes.
- An approach and tool to work **across organizations**

# Summary of Recommendations

- **Include an Operating Plan as part of your partnership agreement**
- **Document it, write it down, reach agreement with all parties**
- **Make your Operating Plan a living document**
- **Do the Operations Analysis before you:**
  - Design
  - Build
  - Sign up for service levels, costs, and implementation

# Summary Reminders and Design Themes

## ➤ **The Operating Plan Drives the Investment for:**

- Processes
- Infrastructure
- Equipment Type
- Resource Requirements

## ➤ **Facility Design themes and focus**

- Eliminate duplication of effort and infrastructure
- Keep the facility design simple and operationally flexible
- Apply technology correctly include it in the operating plan
- Minimize points of conflicts and operational delay
  - Keep trucks away from train movement areas as much as possible

**Thank You**

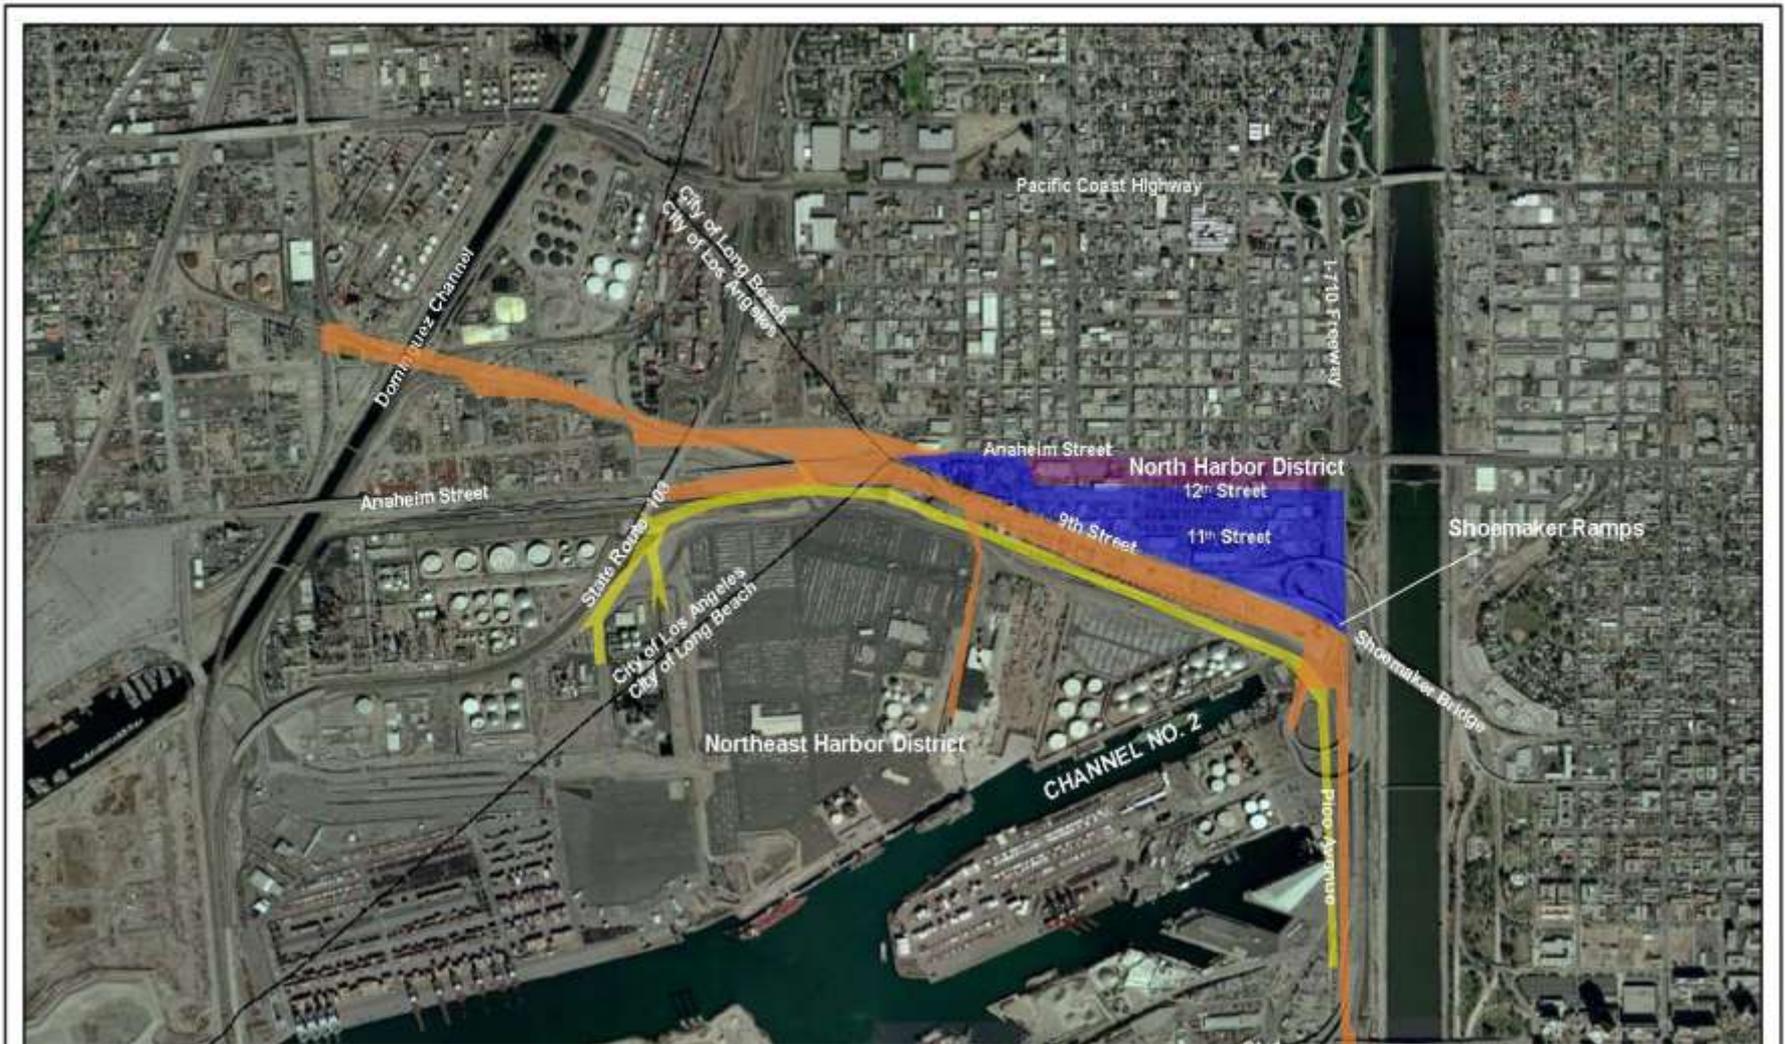

**Project Example If Requested**

## **Port of Long Beach**

# **On Dock Rail Support Operations Planning and Analysis**

# Project Site: North Harbor near I-710 Corridor

Operations Planning and Analysis To Support the Rail and Port Industry

AAPA November 9, 2011

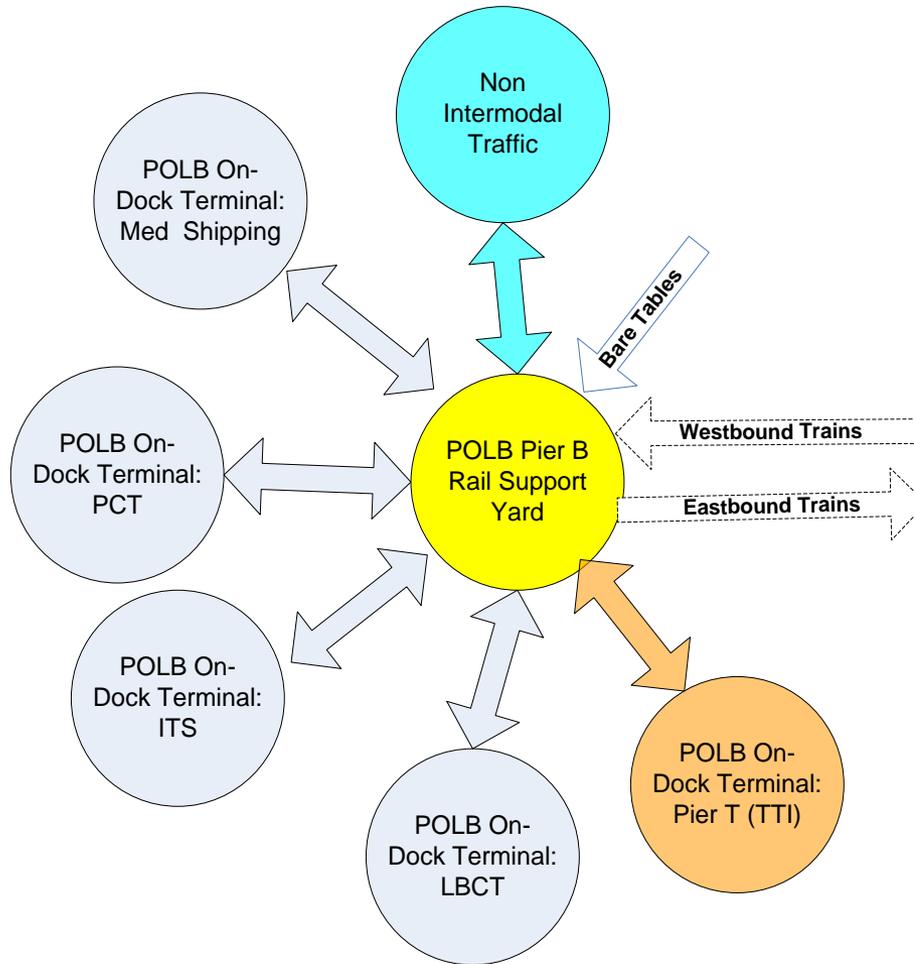

## On Dock Rail Yard Operating Plan is to include

- Limitations of existing on-dock rail capacity at all 5 terminals
- Mixed terminal inbound trains
- Assembly of outbound 10,000 foot sometimes mixed trains
- 20 – 40% imbalance of rail equipment from eastbound to westbound
- Operating hours and rail movement rules.
- Provide rail support for 5 Port of Long Beach on-dock terminals.
- Handle up to 10,000 foot arrival and departure trains
- Provide appropriate railcar staging capacity to meet vessel and rail service plans

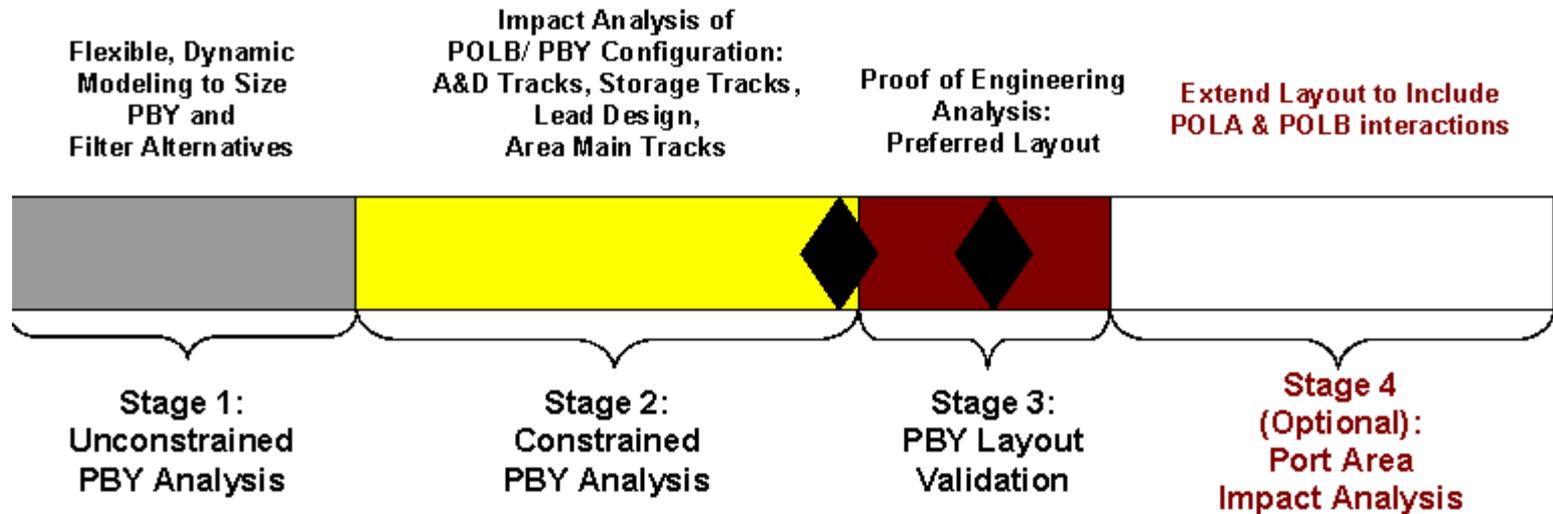

# Operations Planning and Analysis Requirements

- ▶ **Determine what level of infrastructure investment is needed and when to meet volume projections**
- ▶ **Explore operational ways to reduce infrastructure requirements – tradeoffs and impacts**
  - Direct from on-dock terminal departures impacts
  - Share rail support tracks between rail carriers
  - 24 hour unrestricted access to on-dock terminals by railroads
  - Rail equipment management options

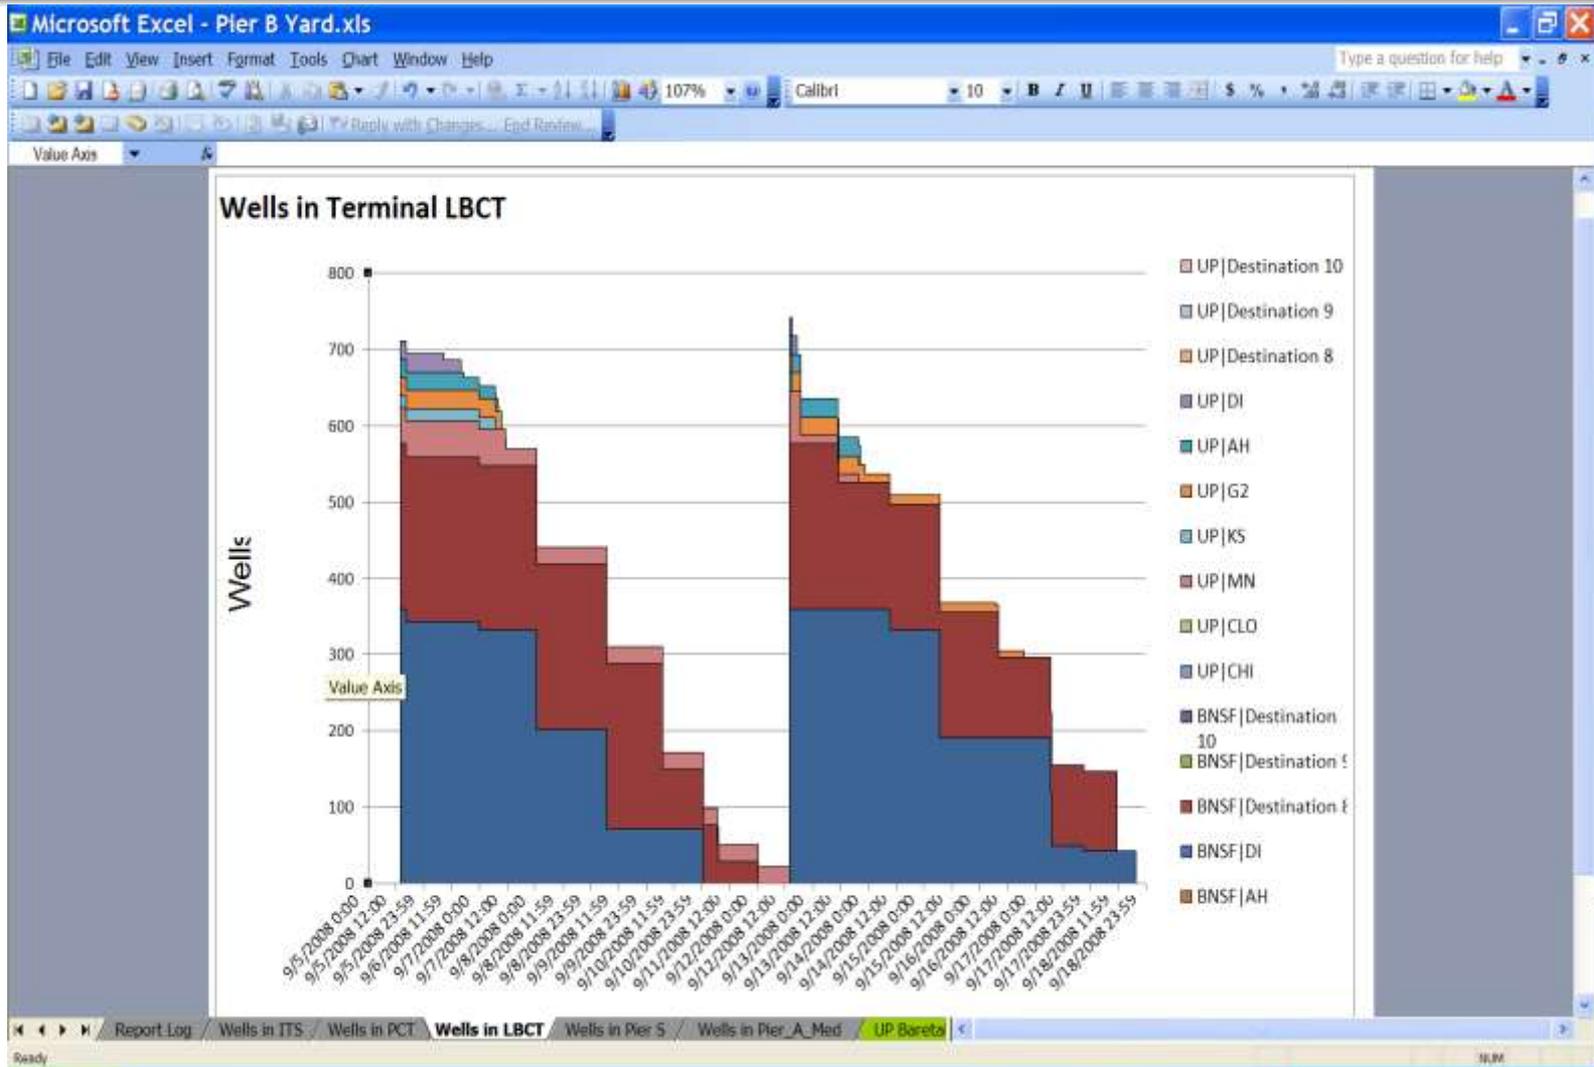

# Port of Long Beach Rail support is a Network of its own

# Multi-Stage Analysis Plan

# The Goal - Move all targeted On-Dock rail volumes through the POLB East Basin

# Concept Iterations Modeling using a Dashboard

## Pier B Yard Sizing Analysis Model
